Car Rental Request Automation in ServiceNow Using Service Catalog and Workflows

Date: 23 September 2026 | Team Member: Vempali Sampath Kumar

1. Introduction

Project Title: Car Rental Request Automation in ServiceNow Using Service Catalog and Workflows Team Member: Vempali Sampath Kumar

2. Project Overview

Purpose: Provide a structured ServiceNow process for car rental requests, approvals and fulfillment. Features: Service Catalog request form, Requested Item creation, approval automation, Catalog Task creation, fulfillment assignment and email notification.

3. Architecture

Frontend/User Interface: ServiceNow Service Catalog / Service Portal. Automation: ServiceNow Flow Designer / Workflow Studio. Data: ServiceNow platform records including Requested Items, approvals and Catalog Tasks. Notification: ServiceNow email action.

4. Setup Instructions

Prerequisites: ServiceNow Developer Instance with permissions to configure Service Catalog and Flow Designer. Configuration: create the catalog item and variables, create the Car Rental Req flow, configure approval, create the approved branch with Catalog Task and Send Email, attach the flow to the catalog item, and test.

5. Configuration Structure

Catalog Item: Car Rental Request. Variables: Requested Date, Pickup Location, Drop Location, Duration, Car Type, Reason. Flow: Car Rental Req. Actions: Ask For Approval → If Approve → Create Catalog Task → Send Email.

6. Running the Application / Workflow

Submit the Car Rental Request in Service Catalog. ServiceNow creates the Requested Item, requests approval and, after approval, creates the Catalog Task and executes the Send Email action.

7. Record / Integration Documentation

Main records: Requested Item, Approval, Catalog Task and Email. Tested request: RITM0000005. Resulting task: SCTASK0010001.

8. Authentication and Authorization

Access is controlled through ServiceNow roles and instance permissions. No separate custom authentication system is implemented.

9. User Interface

The ServiceNow Service Catalog request form is the primary interface for entering rental requirements. Requested Items, approvals and Catalog Tasks provide operational views.

10. Testing

Testing covered request submission, approval, task creation, email record generation and end-to-end flow execution. The completed execution evaluated the approval branch as True and completed all configured actions.

11. Screenshots / Demo

Recommended evidence includes the catalog item, Approved RITM0000005, email record, SCTASK0010001 and completed Flow Designer execution. Add the final demo-video link when available.

12. Known Issues

The recorded execution reported that the email sending property was disabled. The email record was generated as send-ready; actual outbound delivery depends on instance email configuration.

13. Future Enhancements

Performance Analytics dashboards, vehicle availability integration, additional approval levels, SLA/reminder automation, richer reporting and additional notification channels.
